Remote Link and System Link
August 2007

Version 1.37 Software Update

Effective August 2007, all Remote Link and System Link software is being manufactured as Version 1.37 (8/10/07). This version is an update from the 1.36 (5/16/07) software previously shipped and contains new features.

Features

Alarm List

A new option has been added to System>Configure>Remote Link Other tab to enable Alarm List operation. This allows the Alarm List operation to be disabled when Remote Link is not used for panel monitoring.

Enable Alarm/Event Monitoring: Select **Enable Alarm/Event Monitoring** to allow Remote Link to display panel alarms and system event messages in the Alarm List. Uncheck this option when Remote Link is used for programming purposes with a shared database. By default, **Enable Alarm/Event Monitoring** is checked and should be checked when using the Alarm Monitoring module.

Logging Threshold

A new option has been added to System>Configure>Remote Link Other tab which allows the selection of the type of issues to be logged.

Logging Threshold: Select the type of issue to record in the Remote Link error log file. By default, **Logging Threshold** is set to *Warning*. All messages with a severity equal to or greater than the threshold setting will be logged.

- *Debug:* Detailed information that does not indicate an error, similar to communication strings. This setting greatly increases the size of the log file.
- *Information:* General information detail about program operations.
- *Warning:* An error condition such as minor communication problems, timeouts, etc. that can be handled without operator intervention. A warning message may or may not be displayed to the operator.
- *Exception:* An error that requires operator action to recover or restore normal operation such as an invalid COM Port selection for the receiver.
- *Critical:* An error that caused Remote Link to stop responding such as an Access Violation or database corruption.

Ordering the New Software
