FEATURE UPDATE

Virtual Keypad App
March 2012

Version 2.1 Software Update

Effective March 2012, the Virtual Keypad™ app for the Apple iPAD/iPhone and Android systems has been updated to support the enhanced Z-Wave operation for XT30/XT50 Series and XTL panels using Version 110 software.
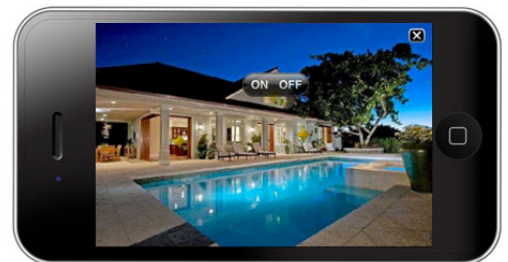

Features

Favorites

The Virtual Keypad App now allows you to group devices as a Favorite. You can program multiple devices (up to 25) to respond to a single button press using the Favorites function. Create and name the Favorite, assign one or more devices to it, and set the command such as ON/OFF or LOCK/UNLOCK for the device. For devices with a range of control, like the thermostat and dimmable lights, you can specify the desired setting. Once programmed, the user presses a single button to execute the programmed settings.

Rooms

Users can now create a touch-screen control for rooms or areas. Using a photo of the room or area, create "hotspots" on the photo that correspond to a Favorite or the Z-Wave devices available. Once programmed, pressing a hotspot on the Room photo activates the Favorite or presents the user with the controls for the device.

Obtaining the New Software

Virtual Keypad app updates are available for download free of charge from the Apple iPAD/iPhone App Store or Google Play (Android Market).
