

NEW FEATURES ⊕ | UPDATED FUNCTIONALITY ↑ | DECEMBER 2019

Version 193 Update

Effective December 23rd, 2019, all XT Series Panels and Com™ Series Universal Communicators are being manufactured with Version 193 (11/15/19) firmware.

Panel Features

Programmable EOL Options (XT30/XT50 and Com Series only)

With Version 193, you now have the option to choose 1k Ohm or 2.2k Ohm for the EOL value for panel zones 1-9. EOL options can be programmed in **System Options** in Panel Programming.

Celsius Temperature Option

You can now program the panel to convert temperatures to Celsius instead of Fahrenheit on Z-Wave thermostats. This change can be found in **System Options** and will display if you select your connected Z-Wave thermostat on the carousel menu, as well as in the Virtual Keypad™ app and Virtual Keypad website.

Wireless Keypad Support

With Version 193, you can now program up to 7 wireless keypads to be sent to wireless receivers on XT30/XT50 Series Panels.

Custom Actions Delay Option and Notification Settings

Custom Actions are now more customizable. You may now enter a time for which a zone must be opened or closed before the action will trigger. Delay values are 0 for no delay, or 1-240 minutes. A push notification can now be sent when the custom action has been activated.

In-App System Panics (Coming Soon)

XT Version 193 now supports in-app system panics. This feature can be enabled in Dealer Admin and activated from the Virtual Keypad app and the Virtual Keypad website.

Panel Enhancements

Z-Wave Battery Signal Improvements

Z-Wave Low Battery messages will now follow the Wireless Audible setting in System Options. This ensures that the keypad will not sound during inappropriate times, such as the middle of the night.

Com Series Exclusive Features

Vista Zone Status Visibility

With Version 193 and when using ECP, you are now able to bypass Vista zones from the Zone Status screen, and the status of Vista panel zones are now visible in the same way that DMP zones are visible from the Virtual Keypad™ App.

Master Code Modification

With Version 193, the Vista panel master code is now able to be modified from Dealer Admin, Virtual Keypad App and Virtual Keypad Browser when using ECP connection.

Push Notification Enhancement

With Version 193, when a user arms or disarms the system on a Vista keypad, the corresponding push notification will include their user information.

Supporting Software Updates

- **Dealer Admin Version 2.26** - Supports Celsius temperature options, master code modification, push notification enhancement, and in-app system panics.
- **Virtual Keypad Version 6.22** - Supports Celsius temperature options, custom action notifications, Vista zone status visibility, master code modification, push notification enhancement, and in-app system panics.
- **Virtual Keypad Website Version 2.20** - Supports Celsius temperature options, custom action notifications, Vista zone status visibility, master code modification, push notification enhancement, and in-app system panics.

Obtaining the New Firmware

XT & Com Series firmware updates are available, free of charge, at dealer.securecomwireless.com or DMP.com/Dealer_Direct.
