

## VirtualKeypad.com

January 2018

### Version 2.1 Update

Effective January 5, 2018, VirtualKeypad.com is updated to Version 2.1. The following features are available.

### Features

#### Instant Arming (*XT30/XT50, XTLplus, and XR150/XR550 control panels*)

Instant arming is now available for users who have All/Perimeter or Home/Sleep/Away systems types and whose systems have been updated to Version 171 firmware or higher. Users are now able to use VirtualKeypad.com to instantly arm their system by hovering their mouse over an arming option, then clicking and holding until their system instantly arms. See Figure 1.

#### Send User Codes to Locks (*XT30/XT50 and XTLplus control panels*)

User codes can now be sent to Z-Wave™ locks on XT Series systems with Version 171 firmware or higher. Simply navigate to **Users** in the navigation panel, then select a user. Click the toggle next to **Send codes to locks** to send that user code to all Z-Wave locks on the system. See Figure 2.

#### Item Search Improvement

Now, when users type within the search bar in **History**, each typed word will filter the event history, narrowing down the history list. This allows users to narrow their search by every typed word, making it easier to search for specific events in their event history.
