TECHNICAL UPDATE

API/App Server
March 2012

Software Update

Effective March 26, 2012 the DMP API/App Server has been updated to Version 1.0.9 (3/26/12). This version contains the following updated operation.

Updated Operation

Version 1.0.9 (3/26/12) server software now allows connection to panels that were configured in Version 1.0.8 (8/27/12) and older software with a Receiver Number greater than 99.

Version 1.0.9 (3/19/12) software revised the Receiver Number range to only allow receiver numbers from 1 to 99. Previously, Version 1.0.8 (8/27/12) and older software would allow numbers much greater than 99. For example: 123456 was allowed. This 1.0.9 (3/19/12) revision to limit the Receiver Number range did not take into account panels that were already configured with a number greater than 99 and therefore the server software could no longer establish a connection to those panels.

Version 1.0.9 (3/26/12) corrects this issue. The Receiver Number range is still limited 1 to 99 for new panels but the server software will also allow a connection to already configured panels with a receiver number greater than 99.
