

## 1121 Hardware Update

November 2007

### Hardware Update

Effective November 2007, all 1121 Wireless PIR Transmitters will be manufactured with updated hardware.

### Updated Hardware

#### Sensitivity Dial

The 1121 Wireless PIR Transmitter now provides a rotary dial for fine tuning the motion detection sensitivity.

#### Auto Power Save Feature

The 1121 Wireless PIR Transmitter now provides an Auto Power Save feature to extend the battery life.

#### Auto Power Save (APS) Feature

In order to extend the battery life, the 1121 is equipped with a two-minute sleep timer that is restarted on every motion detection. This means the unit will awaken after two minutes with no motion detected. This allows the 1121 to be used for busy lobbies or areas that have lots of traffic during the disarmed period.
